

Material Transport System

IH JEONG / KOREA

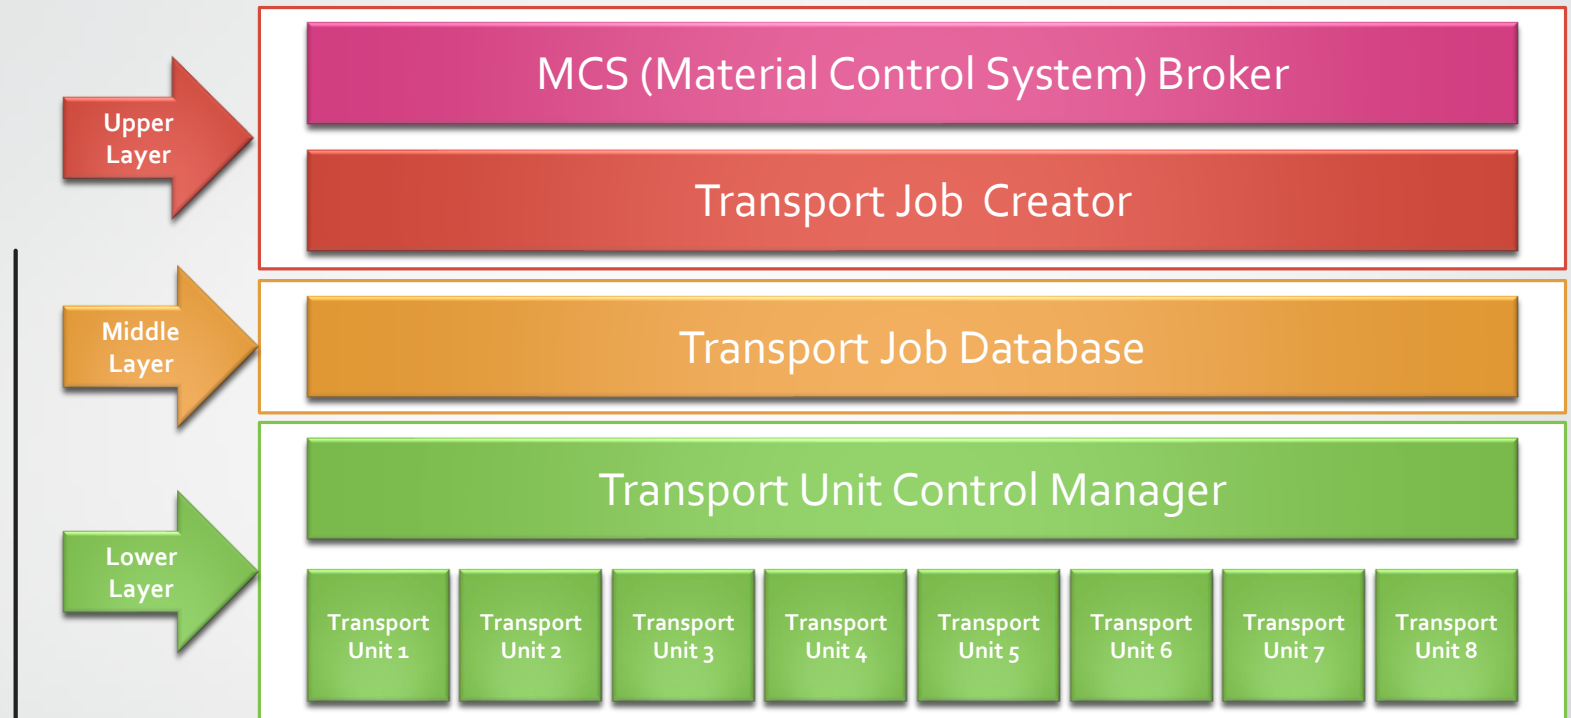

Provide Scalable
Management Solution

Revision 1.0.0.1

Agendas

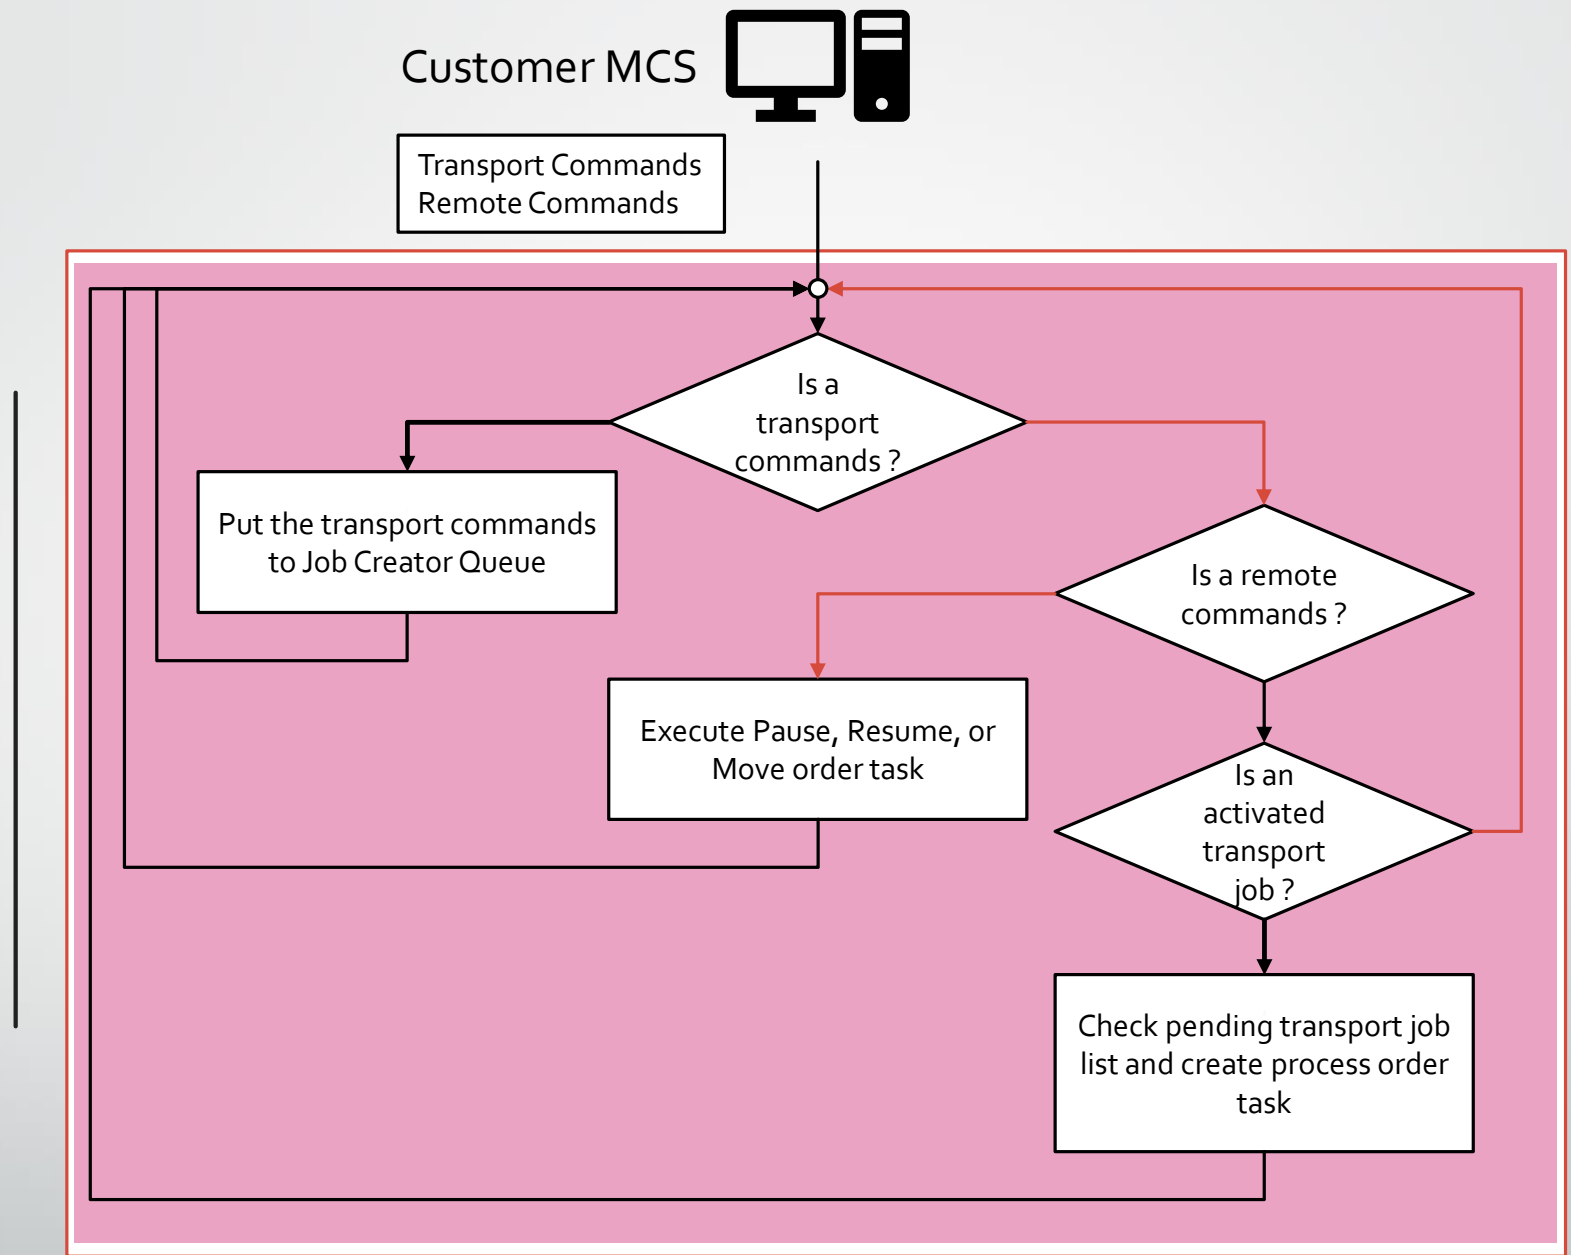

- Structure of MTS
- Structure of MCS (Material Control System) Broker
- Structure of Transport Job Creator
- Structure of Transport Job Database
- Structure of Transport Unit Control Manager
- Goals of MTS
- Applied design concepts

Structure of MTS

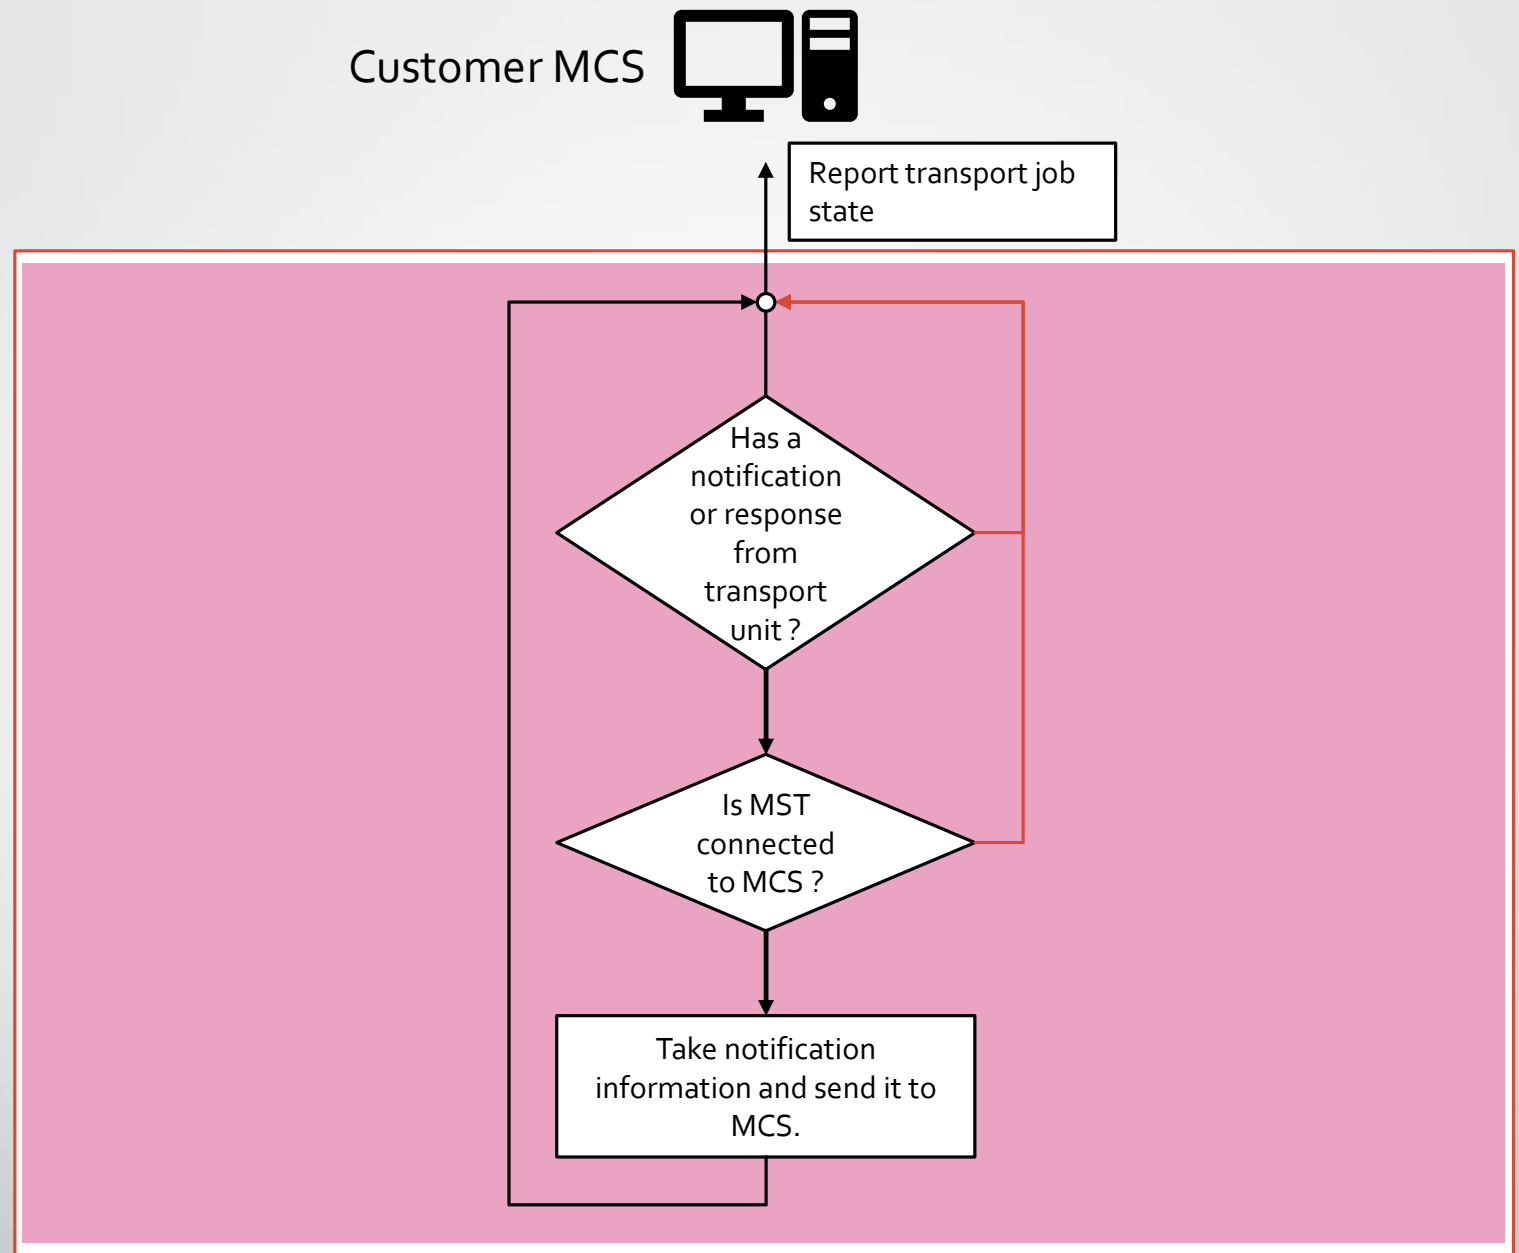

- MTS (Material Transport System) 은 역할에 따라서 3 개의 층으로 나눈다.
- 상위 (MCS Broker Layer)
고객사 MCS (Material Control System) Broker 와 Transport Job Creator 로 구성된다.
- 중간 (Transport Job Database Layer)
Transport Job 을 유지하고, 상태를 관리한다.
- 하위 (Transport Unit Control Manager Layer)
Transport Job 을 수행하는 Unit (최대 8대 반송 로봇) 들의 Transport Job 을 제 및 관리한다.

Structure of MCS Broker

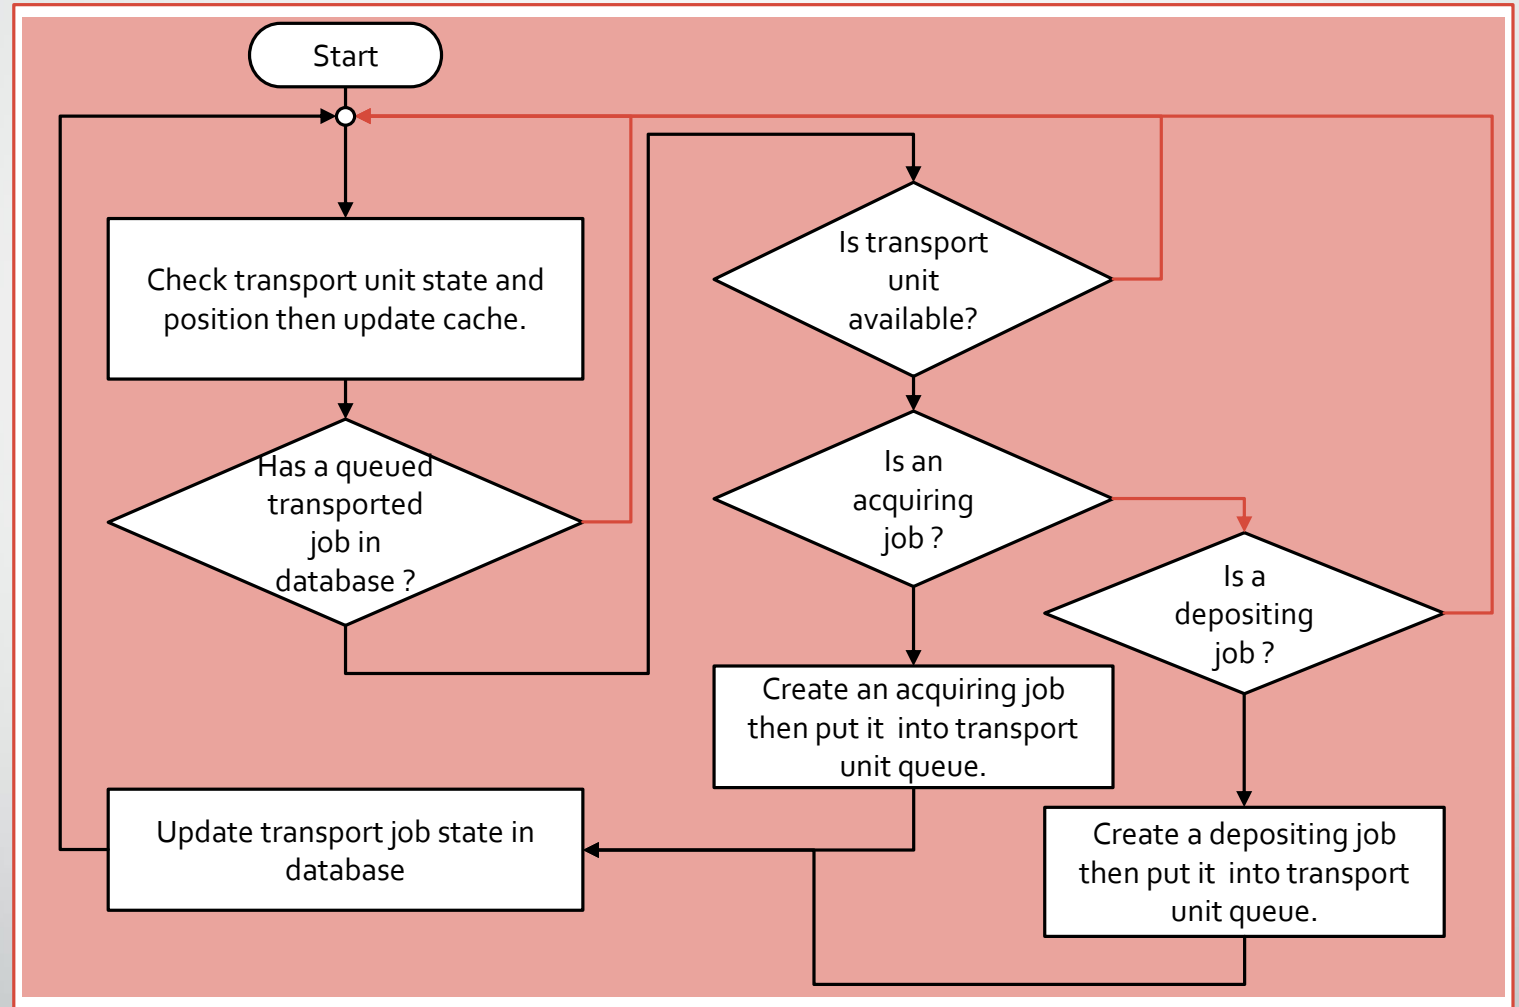

- MCS Broker 의 Remote Commands 별 Task 호출

Structure of MCS Broker (Contd.)

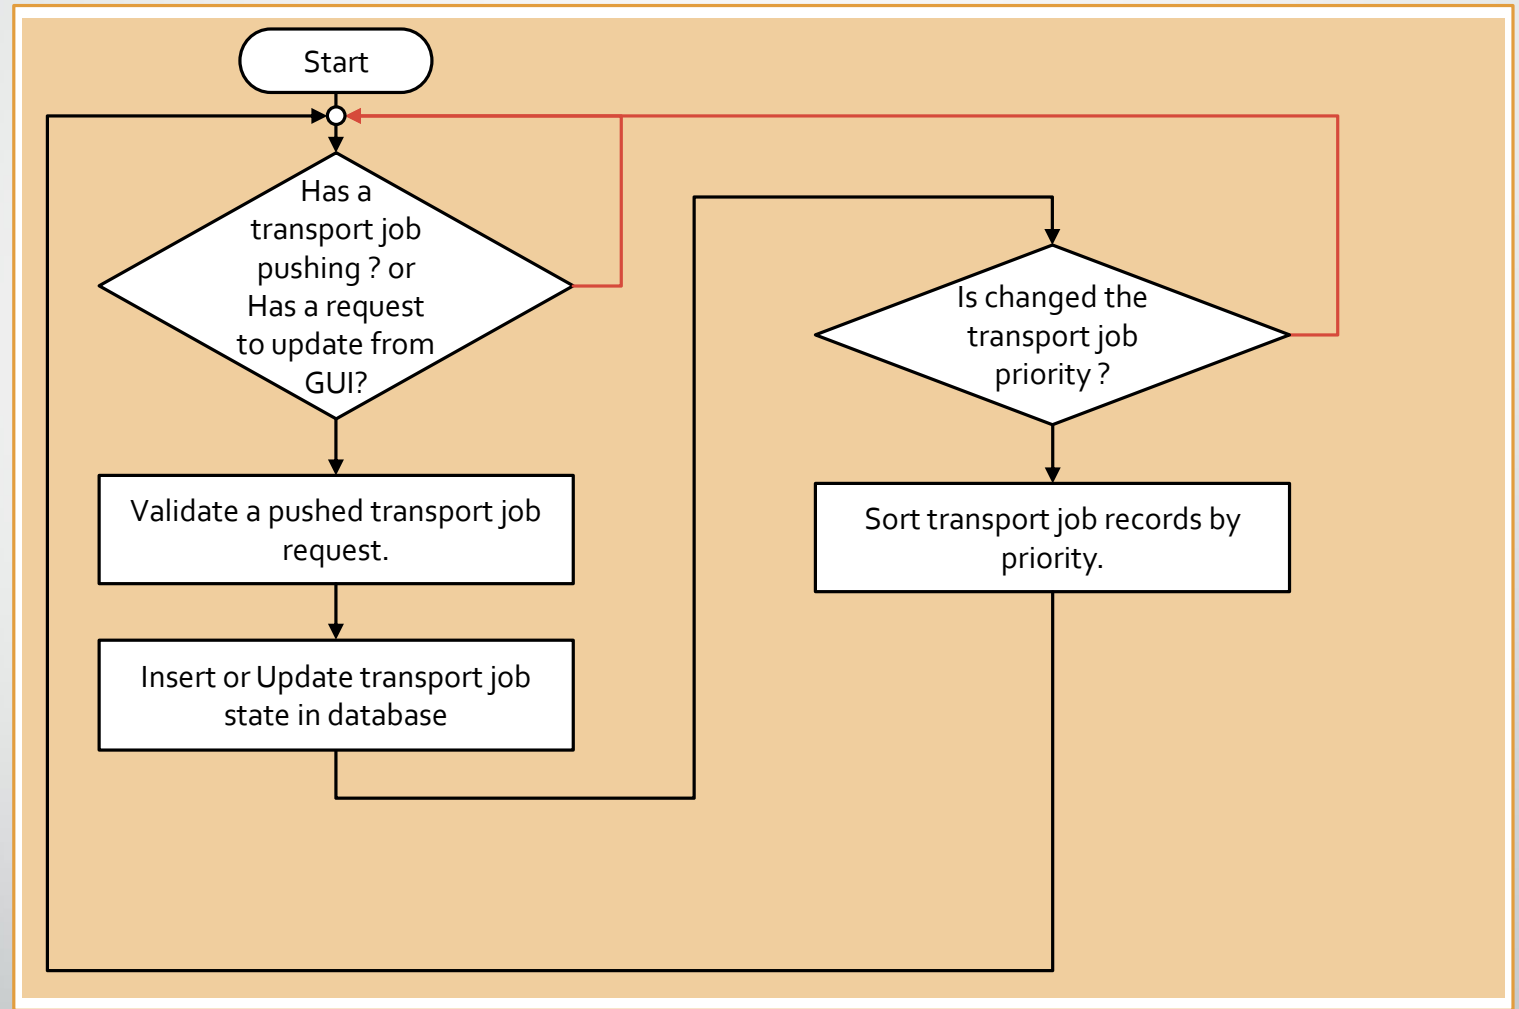

- Transport unit 의 응답과 이벤트를 MCS 로 전송.

Structure of Transport Job Creator

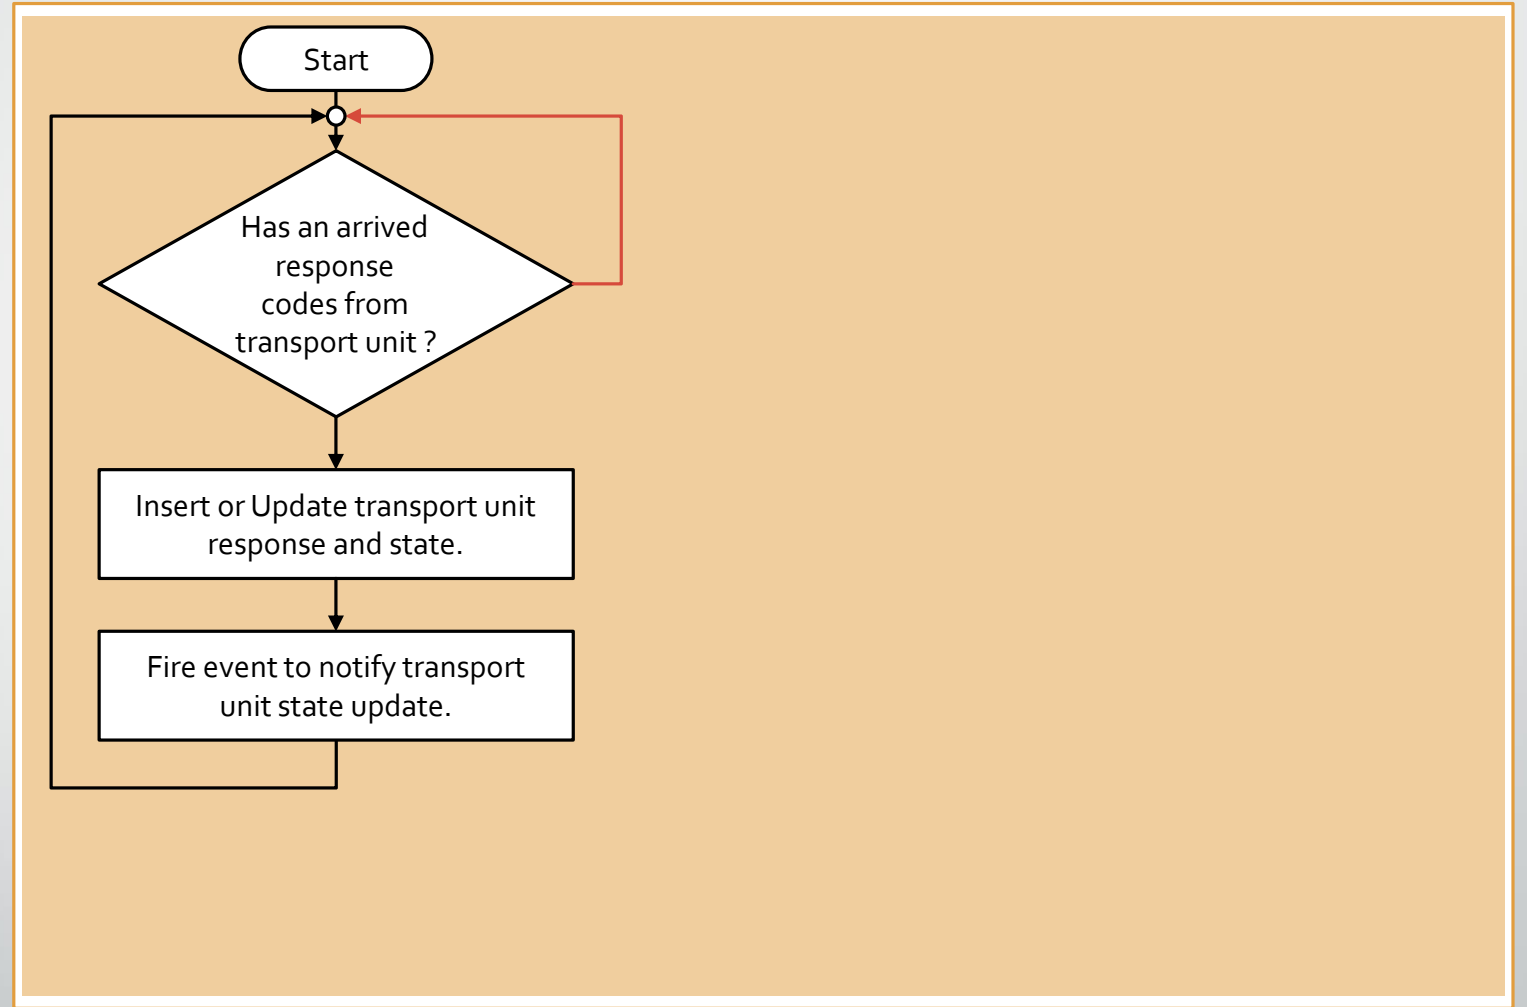

- Transport Job Creator 는 Transport Unit 상태와 Transport Job pending 여부에 따라서, RUN 상태일 경우 항상 Transport Job 을 생성 배정한다.

Structure of Transport Job Database

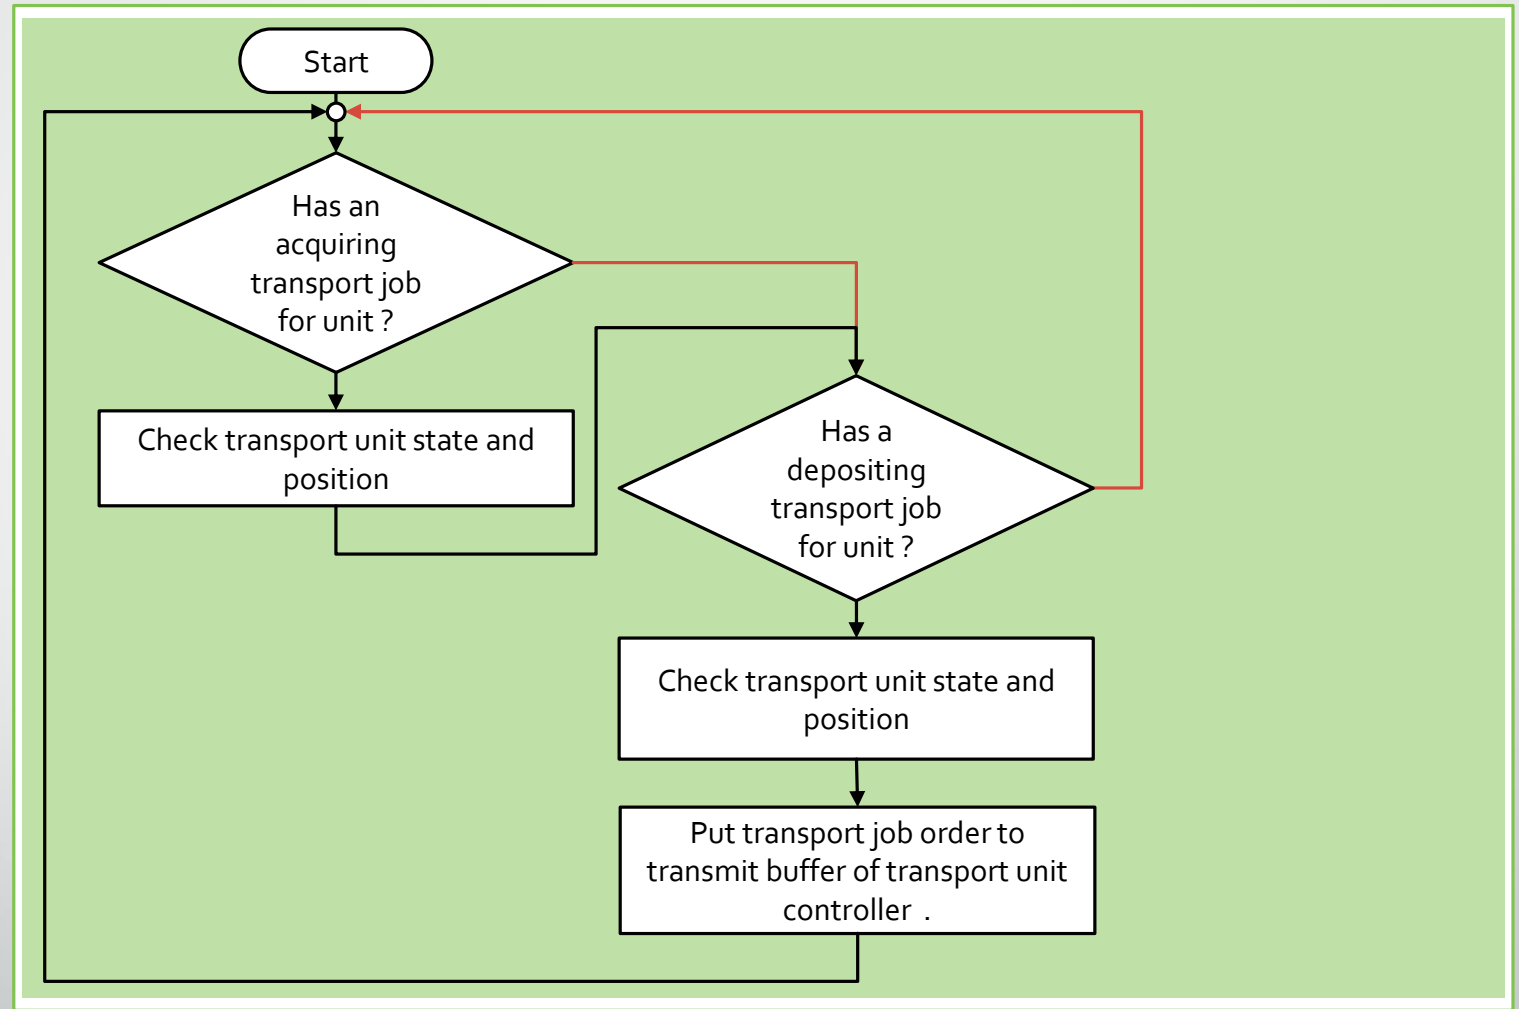

- Transport Job Database 는 transport job pushing 이 있을 경우, transport job 을 등록하며, 관리자의 transport job 우선 순위 변경에 pending 순서를 변경한다.

Structure of Transport Job Database (Contd.)

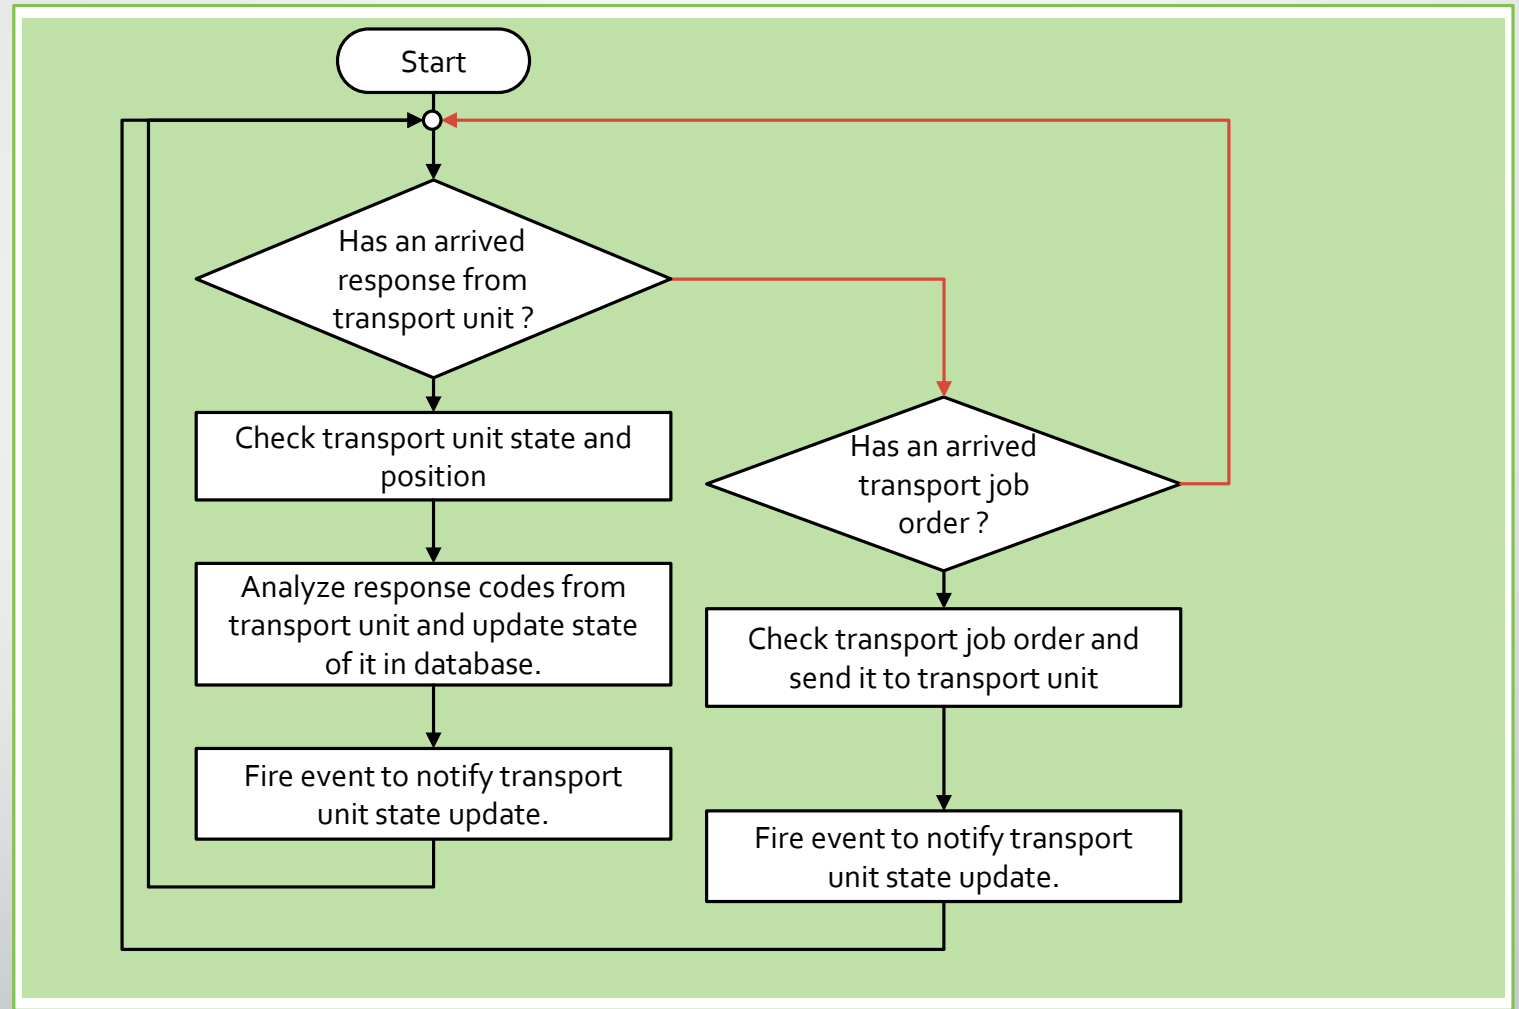

- Transport Job Database 는 transport unit state 가 변경되면, 이를 update 하고, MCS Broker 에게 이를 통지한다.

Structure of Transport Unit Control Manager

- Transport Unit Control Manager 는 Transport Job Creator 에 의해 생성된 transport job 을 transport unit controller 에게 전달하고, transport unit controller thread 에 반송 명령을 전달한다.

Structure of Transport Unit Control Manager (Contd.)

- Transport Unit Controller 의 응답은 transport job database 에 각 transport unit state 테이블에 update 된다.

Goals of MTS

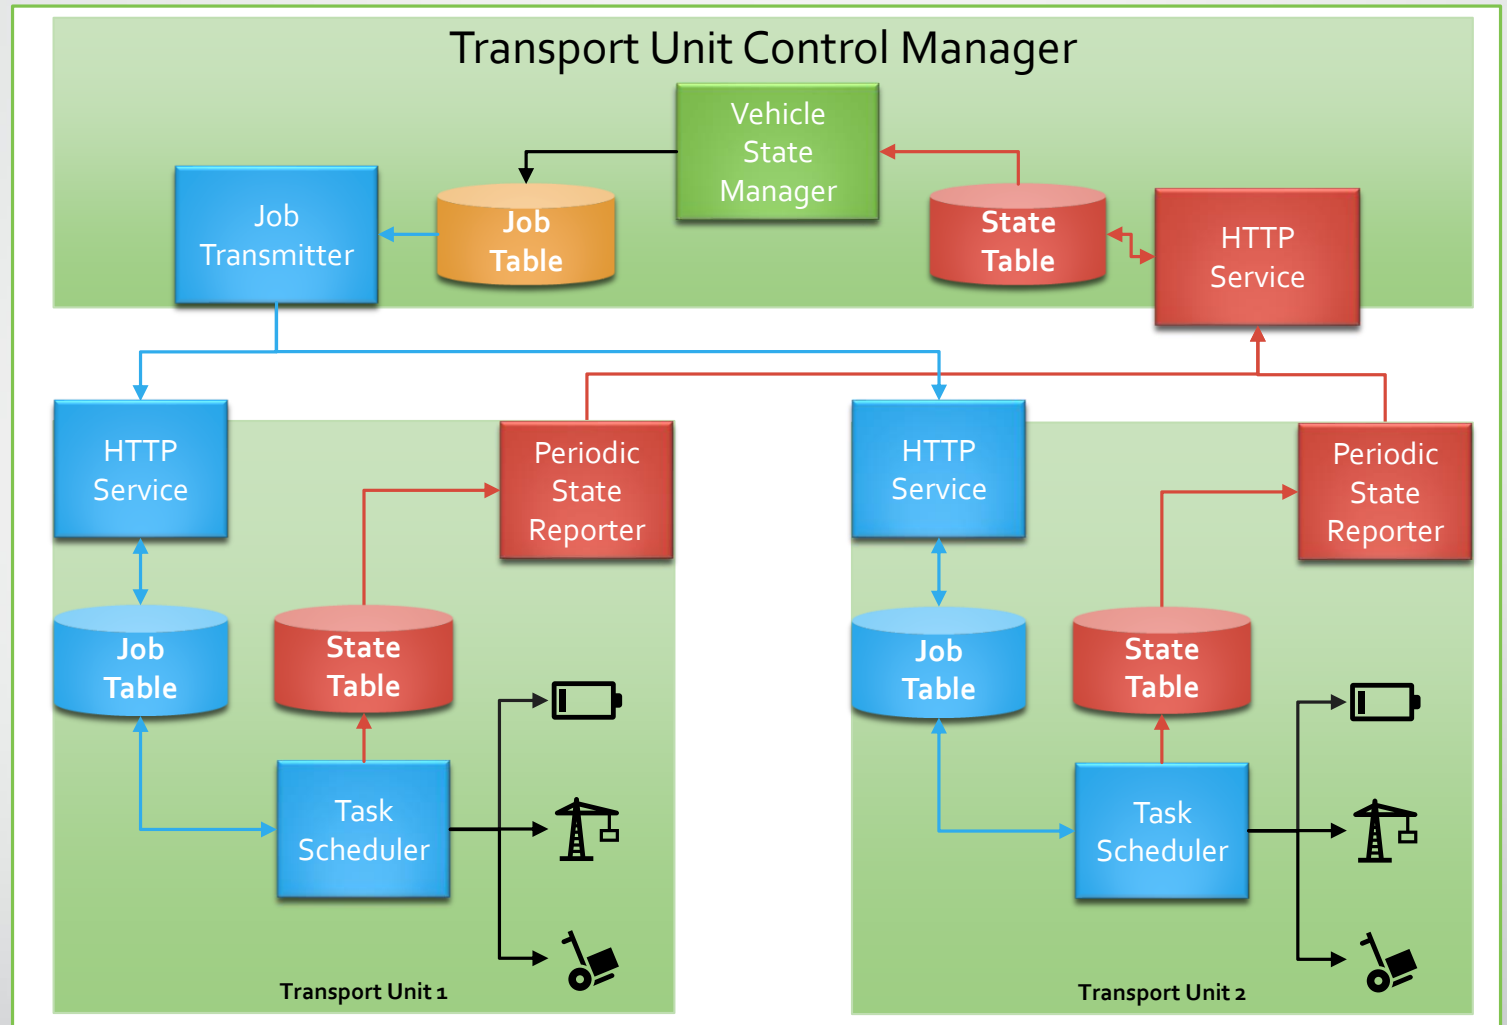

- Provides distributed process task by process modules.
- Provides stable server modules.
- Provides runtime monitoring and service restart features.
- Provides extendable transport unit control manager to manage 8 vehicles. (One license supports to control 8 vehicles.)
- Provides database server divide from MTS to support heavy transaction.
- Provides external schema synchronizing.
- Provides transport job Creator and customizing of job creation by option.
- Provides MCS Broker interface and customizing.

Notice: The 1st phase goals are Marked items by red color.

Applied Design Concepts

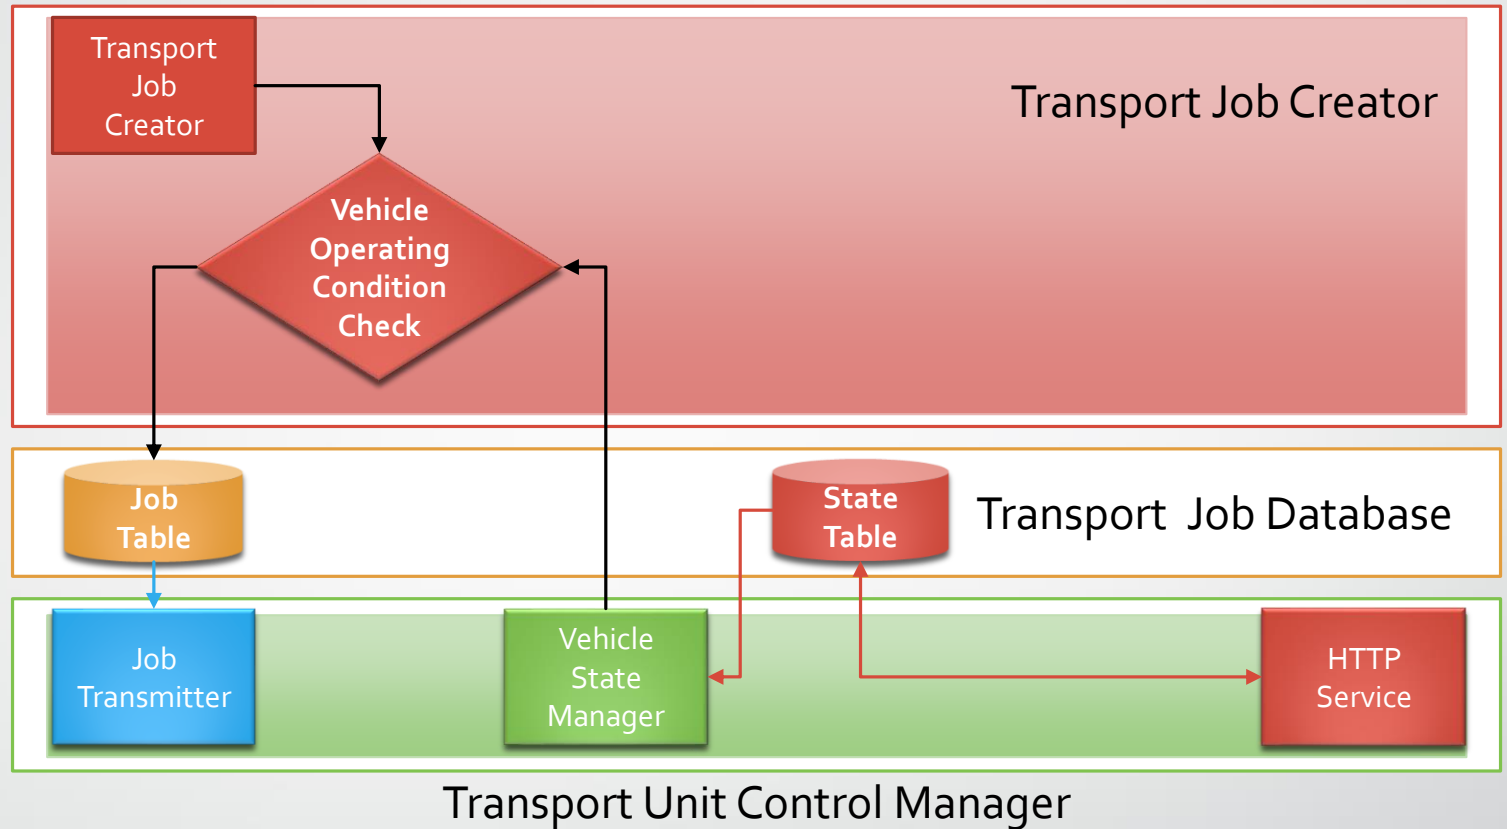

- This project contained general mediator device concept. The detail system structure and implementation plan notes will be added with below technical information.
 - MSMQ (Microsoft Message Queue)
 - MSSQL Server (Microsoft Database Server Express)
 - SECS/GEM specification for AMHS-AGV (Samsung V1.8)

Data Flow of Transport Unit Control Manager

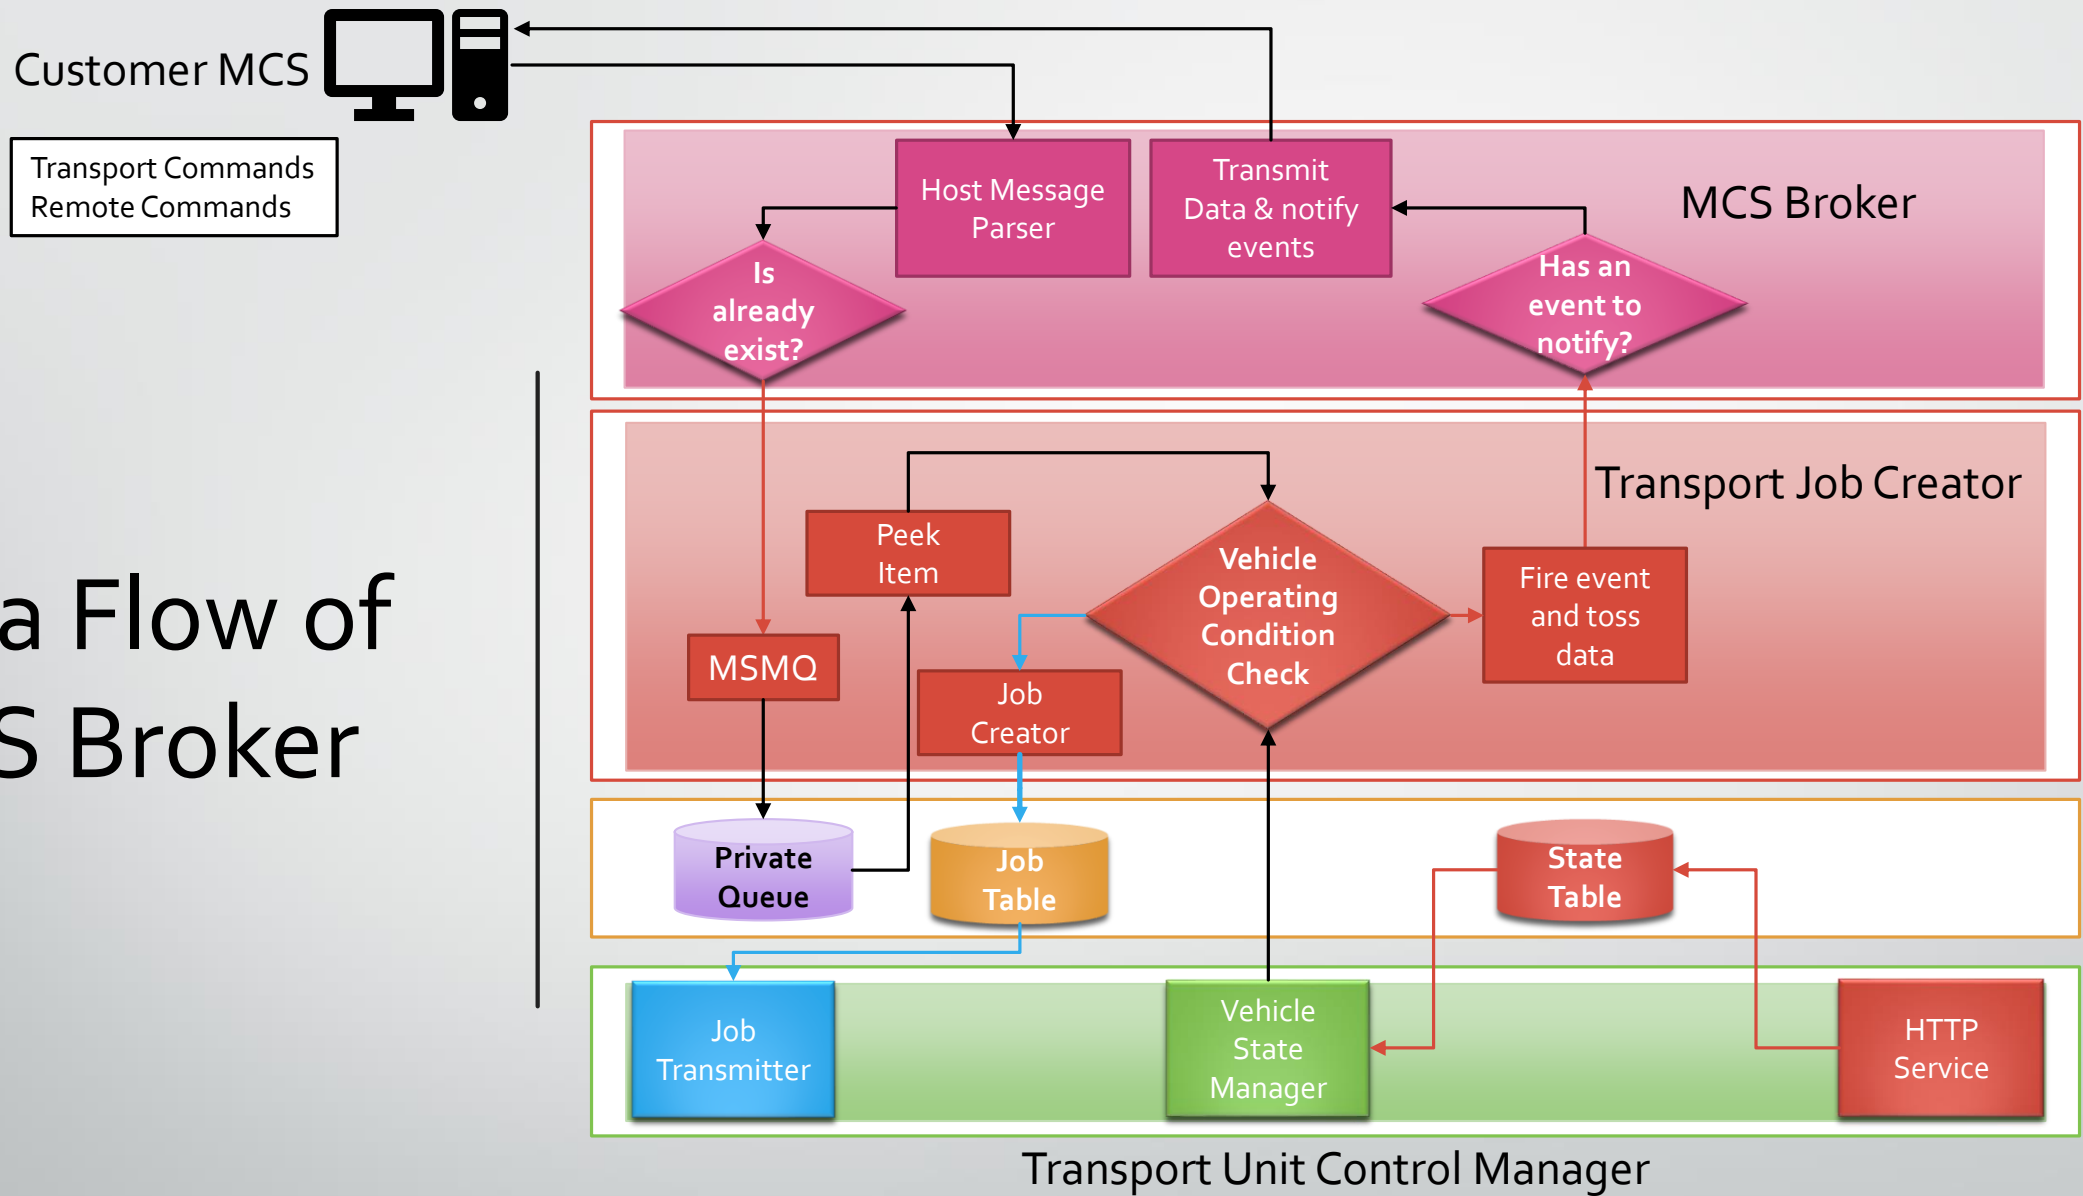

- Transport Unit 과 Transport Unit Control Manager 간의 데이터 및 상태 정보 연동 흐름도

Data Flow of Transport Job Database & Transport Job Creator

- Transport Unit Control Manager 은 각 Vehicle 의 상태 정보는 Transport Job Creator 가 참조하여, Transport Job 생성, 갱신, 삽입, 삭제, 할당 등에서 주요 정보로 사용된다.

Data Flow of MCS Broker

- MCS Broker 는 고객사의 MCS 와 연동하며, Transport Job 생성을 위한 pending list 를 생성하고, Transport Unit Control Manager 로 부터 전달되는 event 와 데이터를 명령을 응답과 함께 고객사 MSC 로 전송한다.
